

NEW AUTOMATIC SPOT WELDERS FROM GYS

GYS, the French manufacturer of car body repair equipment has announced the launch of a major advance in functionality in their latest range of Spot Welders named 'Energy Dynamic Control' (EDC) this technology provides fully automatic setting of the machine requiring no parameter input from the operator.

The new proprietary technology (patent pending) will set the spot welding parameters automatically taking account of metal thickness and the resistance variations of high strength metals. Benefits include ease of use but importantly a reduction in the chance of incorrect settings being applied to the weld. This technology is fitted to the range of GYS C Clamp Spot Welders which carry vehicle manufacturer approvals.

This launch coincides with a change in distribution strategy by GYS, who are now supporting a network of Equipment, Paint and Parts distributors directly from the GYS UK headquarters in Warwick.

GYS manufacture their Spot Welding range in France and are the largest provider of Spot Welding equipment to Bodyshops across Europe and are now expanding their UK operations.
